

SUSHAN SUNUWAR

Frontend Software Engineer | React . Typescript . Product Engineering

London, United Kingdom | +44 7350 192155 | koinchsushan@gmail.com

linkedin.com/in/sushan-sunuwar | github.com/koinchsushan

Professional Summary

Software engineer with 3+ years' commercial experience, specialising in React and TypeScript frontends and the design systems behind them. Shipped micro-frontend modules on a US healthcare platform serving 450,000+ users and an ML-backed quotation interface processing 10,000+ documents daily for a Netherlands aerospace client. Now one of five engineers at an early-stage London startup, shipping production features on roughly two-week cycles by pairing hands-on engineering with AI-assisted development. Comfortable owning a feature from scoping through API design to production deploy. MSc Data Analytics with Distinction adds Python, SQL and statistical modelling — effective on data-heavy product surfaces where interface and data model have to be reasoned about together.

Skills

Languages: TypeScript, JavaScript (ES6+), Python, SQL, HTML5, CSS3

Frontend: React, Next.js, Redux, Redux-Saga, React Query, Context API, Angular, Chart.js, Flutter

Design Systems & UI: Design tokens, component libraries, Material UI, Ant Design, Tailwind CSS, Styled-components, SASS, Figma-to-code, responsive design

Accessibility & Performance: WCAG 2.1 AA, semantic HTML, ARIA, Core Web Vitals, code splitting, lazy loading, tree shaking

Architecture: Micro-frontends (Single-SPA), Clean Architecture, MVVM, component-driven design, SSR/SSG, legacy-system integration, Agile/Scrum

Backend & APIs: Flask, Node.js, REST API design, GraphQL, WebSockets, webhooks, Axios

AI-Assisted Development: Claude Code, GitHub Copilot, Codex

Cloud & Infrastructure: Firebase, Railway, Render, Docker, Stripe

Testing & CI/CD: Jest, Vitest, React Testing Library, pytest, TDD, ESLint, Prettier, Husky, GitLab CI, GitHub Actions, Git

Data: Pandas, Matplotlib, scikit-learn, statistical modelling, SHAP, Power BI, data visualisation

Professional Experience

Foundermatcha, London (Early-stage AI matchmaking startup, live product, ~3,000 users)

Software Engineer | React, TypeScript, Flutter, Python/Flask, Firebase

Jun 2026 – Current

- Doubled the connections users make on the platform by designing its networking layer: shareable invite codes, email invites that auto-connect at signup, and group chats. Kept networking out of the matching pool with a dedicated group data model.
- Replaced email-only customer support with real-time in-app chat, built from scratch. Extended the React and TypeScript admin panel so internal staff answer users in one place instead of an inbox.
- Opened the product to a second user type with a lightweight member role across the React admin panel and Flutter app, including its onboarding conversation and concierge persona inside the existing LangGraph conversational AI.
- Cut the cost of every future messaging feature by consolidating four divergent chat implementations into one shared component layer, now powering all five product surfaces. Followed with an app-wide design-system pass to a Figma spec unified tokens and a single CTA system.
- Built the product's transactional email infrastructure from scratch: a provider-agnostic transport with a test double, plus a signature-verified bounce webhook maintaining a suppression list to protect deliverability as volume grows.
- Shipped each of these on a two-week cycle in a five-engineer team while scoping with the lead engineer, deploying to production myself, and using Claude Code throughout to reach tested, reviewed code faster.

Viveka Services, Remote (US Healthcare Client)

Frontend Software Engineer | TypeScript, Single-SPA, Redux, Git

Jul 2024 – Mar 2025

- Shipped micro-frontend modules with Single-SPA on a healthcare platform serving 450,000+ users, replacing a coordinated release train with independent per-squad deployments.
- Designed and built the platform's shared React component library (Material UI, Styled-components) to WCAG 2.1 AA, giving every feature team one accessible, Figma-accurate source of UI truth and removing duplicated component work across squads.

- Re-architected global and async state with React and Redux across eligibility processing, contract configuration and employee data management, resolving the cross-module data inconsistencies surfacing stale records to users.
- Cut bundle size ~30% and lifted Core Web Vitals on the highest-traffic workflows via route-level code splitting, lazy loading and tree shaking across the Webpack and Vite build.
- Owned the frontend GitLab CI pipeline end to end, automating build, test and deploy so every merge to main was release-ready without manual intervention.
- Drove Jest and React Testing Library coverage across business-critical workflows under TDD, and reviewed pull requests with a focus on architecture, consistency and accessibility regressions.
- Delivered critical business features like eligibility processing, contract configuration, and employee data management within Agile sprints, collaborating with backend, QA, and product stakeholders.

Javra Software, Remote (Netherlands Aerospace Client)

Frontend Software Engineer | React, Chart.js, Ant Design

Mar 2022 – Jun 2024

(Progressed: Intern → Junior Developer → Frontend Developer)

- Built the React and TypeScript frontend for an ML-powered quotation system extracting structured data from 10,000+ emails per day, replacing a fragmented manual process and enabling the operations team to handle quote volume that previously required additional headcount.
- Designed interactive Chart.js data-visualisation dashboards, turning dense operational data into decision-ready views used by client stakeholders.
- Built and maintained an Ant Design component library adopted across multiple client products by a 4–6 engineer team, standardising UI patterns and cutting per-feature build time by 20–30%.
- Embedded React components into live jQuery and .NET MVC systems, enabling incremental modernisation of production software without a rewrite or service interruption.
- Kept state management and responsive UI consistent across 3+ concurrent client products in React, TypeScript and Redux, including cross-browser support.

Research Engineering

London Metropolitan University, UK (Faculty-led behavioural research study)

Lead Developer & Co-Author | Python, Flask, Chart.js, Pandas, Matplotlib

Sep 2025 – Current

- Turned three researchers' separate local Python scripts into one live web application covering 845 trials from 228 participants. Findings any reader can open in a browser replaced results only their authors could reproduce.
- Removed the team's dependency on a developer for new data with self-service dataset upload. Validated, atomically written and revertible in one click. Backed by a 21-test suite covering the pipeline and upload safety.
- Made the findings legible to non-technical readers with an interactive visualisation layer: animated trial replay, spatial heatmaps, learning curves and error-pattern breakdowns across eight analyses, unified by a tokenised design system with full dark mode.
- Published open-source under MIT with a contributor guide and documented releases; now forked by three collaborators. Co-authoring the resulting paper on the blank-card hint effect.

Education

MSc in Data Analytics

London Metropolitan University, United Kingdom

May 2025 – Jun 2026

- Dissertation: Data-Driven Decision Support System for UK Housing Affordability, a multi-layer analytics pipeline with predictive modelling and SHAP-based interpretability.
- Modules: Data Analysis & Visualisation; Programming for Data Analytics (Python, R, SQL); Data Mining & Machine Learning; Statistical Modelling & Forecasting.

BSc in Computer Science and Information Technology (CSIT)

Tribhuvan University, Nepal

2018 – 2023

- Final year project: React application consuming a Naive Bayes prediction model over a REST API.
- Modules: Data Structures & Algorithms; Object-Oriented Programming; Web Technology; Database Management Systems; System Analysis & Design.
